III.A. Introduction

This Module provides guidance on the planning, conduct, reporting, and follow-up of pharmacovigilance inspections in Lebanon and outlines the role of the different parties involved. General guidance is provided under III.B., while III.C. covers the overall operation of pharmacovigilance inspections in Lebanon.

To determine that marketing authorization holders comply with pharmacovigilance obligations established within Lebanon, and to facilitate compliance, the national competent authority concerned shall conduct pharmacovigilance inspections of marketing authorization holders or service providers employed to fulfill marketing authorization holders' pharmacovigilance obligations. Such inspections shall be carried out by inspectors appointed by the national competent authority and empowered to inspect the premises, records, documents, and Pharmacovigilance System Master file (PSMF) and /or Pharmacovigilance Subsystem File (PSSF) of the marketing authorization holder or any service providers employed by the marketing authorization holder to perform the pharmacovigilance activities. In particular, marketing authorization holders are required to provide, on request, the pharmacovigilance system master file and /or pharmacovigilance subsystem file, which will be used to inform inspection conduct (see Module II).

The objectives of pharmacovigilance inspections are:

- To determine that the marketing authorization holder and/or its appointed service provider has personnel, systems, and facilities in place to meet their pharmacovigilance obligations; where pharmacovigilance activities are delegated, the marketing authorization holder shall retain overall responsibility and demonstrate sufficient oversight and control over all delegated responsibilities. This includes oversight of local affiliate performing pharmacovigilance activities, such as distributors and warehouses in Lebanon, where applicable. The competent authority may assess such oversight through inspection of the marketing authorization holder's PSMF and /or PSSF.
- To identify, record, and address non-compliance which may pose a risk to public health.
- To use the inspection results as a basis for enforcement action, where considered necessary.

For marketing authorization holders of products in Lebanon, it is the responsibility of the national competent authority to verify that the marketing authorization holder or its service provider, in case of subcontracted PV activities, satisfies the national pharmacovigilance requirements. The pharmacovigilance system master file, or a link to it, shall be located either where the main

33 pharmacovigilance activities of the marketing authorization holder are performed or where the
34 qualified person responsible for pharmacovigilance/local safety person operates. The national
35 competent authority may conduct pre-authorization inspections to verify the accuracy and successful
36 implementation of the existing or proposed pharmacovigilance system.

37 Pharmacovigilance inspection programs will be implemented, which will include routine inspections
38 scheduled according to a risk-based approach and will also incorporate “for cause” inspections, which
39 have been triggered to examine suspected non-compliance or potential risks, usually with impact on
40 a specific product(s).

41 The results of an inspection will be provided to the inspected entity, who will be given the opportunity
42 to comment on any non-compliance identified. Any non-compliance should also be rectified by the
43 marketing authorization holder in a timely manner through the implementation of a corrective and
44 preventive action plan.

45 If the outcome of the inspection is that the marketing authorization holder does not comply with the
46 pharmacovigilance obligations, the national competent authority concerned shall take the necessary
47 measures to ensure that a marketing authorization holder is subject to effective, proportionate, and
48 dissuasive penalties.

49 Sharing of information and effective communication between pharmacovigilance **inspectors**, who
50 conduct compliance inspections of systems and processes (including the PSMF and CAPAs), and
51 **assessors**, who perform scientific and regulatory assessment of safety data (such as PSURs, signals,
52 and RMPs), is essential to ensure appropriate prioritization and targeting of inspections, as well as
53 proper follow-up and the formulation of recommendations on actions to be taken. Although
54 inspectors and assessors operate with different competencies, workflows, and often different
55 reporting lines, close collaboration between these functions is critical. To further enhance
56 transparency, the competent authority may consider publishing biannual or annual
57 pharmacovigilance inspection summary reports.

58 **III.B. Structures and processes**

59

60 **III.B.1. Inspection types**

61 *III.B.1.1. System and product-related inspections*

62 Pharmacovigilance system inspections are designed to review the procedures, systems, personnel,
63 and facilities in place and determine their compliance with regulatory pharmacovigilance obligations.

64 As part of this review, product-specific examples may be used to demonstrate the operation of the
65 pharmacovigilance system. Where pharmacovigilance tasks are subcontracted, inspections may also
66 cover any service provider performing such activities in whole or in part on behalf of, or in conjunction
67 with, the marketing authorization holder. These service providers shall be subject to audit by or on
68 behalf of the marketing authorization holder and may be inspected by the national competent
69 authority, irrespective of whether the obligation to agree to an audit or inspection is explicitly included
70 in the subcontract. While the marketing authorization holder retains overall responsibility for
71 pharmacovigilance compliance, shortcomings identified at the level of subcontracted service
72 providers shall not compromise the conduct, scope, or effectiveness of audits and inspections.

73 Product-related pharmacovigilance inspections are primarily focused on product-related
74 pharmacovigilance issues, including product-specific activities and documentation, rather than a
75 general system review. Some aspects of the general system may still be examined as part of a product-
76 related inspection (e.g., the system used for that product).

77

78 *III.B.1.2. Routine and “for cause” pharmacovigilance inspections*

79 Routine pharmacovigilance inspections are inspections scheduled in advance as part of inspection
80 programs. There is no specific trigger to initiate these inspections, although a risk-based approach to
81 optimize supervisory activities should be implemented. These inspections are usually system
82 inspections but one or more specific products may be selected as examples to verify the
83 implementation of the system and to provide practical evidence of its functioning and compliance.
84 Particular concerns, e.g., raised by assessors, may also be included in the scope of a routine inspection,
85 in order to investigate the specific issues.

86 For cause, pharmacovigilance inspections are undertaken when a trigger is recognized, and an
87 inspection is considered an appropriate way to examine the issues. For cause inspections are more
88 likely to focus on specific pharmacovigilance processes or to include an examination of identified
89 compliance issues and their impact on a specific product. However, full system inspections may also
90 be performed, resulting from a trigger. For-cause inspections may arise when, for example, one or
91 more of the triggers listed below are identified (but are not limited to):

92 **▪ Risk–benefit balance of the product:**

93 • change in the risk–benefit balance where further examination through an inspection is
94 considered appropriate;

95 • delays or failure to identify or communicate a risk or a change in the risk–benefit balance;

96 • communication of information on pharmacovigilance concerns to the general public without
97 giving prior or simultaneous notification to the national competent authorities, as applicable;
98 • non-compliance or product safety issues identified during the monitoring of
99 pharmacovigilance activities by the national competent authorities;
100 • suspension or product withdrawal with no advance notice to the national competent
101 authorities.

102 ▪ **Reporting obligations (expedited and periodic):**

103 • delays or omissions in reporting;
104 • poor-quality or incomplete reports;
105 • inconsistencies between reports and other information sources.

106 ▪ **Requests from the national competent authorities:**

107 • failure to provide the requested information or data within the deadline specified by the
108 national competent authorities;
109 • poor-quality or inadequate provision of data to fulfil requests for information from the
110 national competent authorities.

111 ▪ **Fulfilment of commitments:**

112 • concerns about the status or fulfilment of risk management plan (RMP) commitments;
113 • delays or failure to carry out specific obligations relating to the monitoring of product safety,
114 identified at the time of the marketing authorization;
115 • poor quality of reports requested as specific obligations.

116 ▪ **Inspections:**

117 • delays in the implementation or inappropriate implementation of corrective and preventive
118 actions;
119 • information such as non-compliance or product safety issues from other types of inspections,
120 where applicable (GCP, GMP, GLP, and GSDP);
121 • inspection information received from other international authorities, which may highlight
122 issues of non-compliance.

124 ▪ **Other triggers:**

125 • concerns following review of the pharmacovigilance system master file;

126 • non-inspection-related information received from other authorities, which may highlight

127 issues of non-compliance;

128 • other sources of information or complaints

129

130 *III.B.1.3. Pre-authorization inspections*

131 Pre-authorization pharmacovigilance inspections are inspections performed before a marketing

132 authorization is granted. These inspections are conducted with the intent of examining the existing or

133 proposed pharmacovigilance system as the applicant has described it in support of the marketing

134 authorization application. Pre-authorization inspections are not mandatory but may be requested in

135 specific circumstances. Principles and procedures for requesting pre-authorization inspections should

136 be developed to avoid performing unnecessary inspections, which may delay the granting of a

137 marketing authorization. The following aspects shall be considered during the validation phase and/or

138 early during the assessment phase:

139 ▪ The applicant has not previously operated a pharmacovigilance system in Lebanon or is in the

140 process of establishing a new pharmacovigilance system;

141 ▪ Previous information (e.g., inspection history and non-compliance notifications or information

142 from other authorities) indicates that the applicant has a poor history or culture of compliance. If

143 the marketing authorization holder has a history of serious and/or persistent pharmacovigilance

144 non-compliance, a pre-authorization pharmacovigilance inspection may be one mechanism to

145 confirm that improvements have been made to the system before a new authorization is granted;

146 ▪ Due to product-specific safety concerns, it may be considered appropriate to examine the

147 applicant's ability:

148 – to implement product-specific risk-minimization activities; or

149 – to meet specific safety conditions which may be imposed; or

150 – to manage routine pharmacovigilance for the product of concern (e.g., anticipated

151 significant increase in adverse reaction reports compared to previous products).

152 In most cases, a risk assessment based on a combination of product-specific and system-related issues
153 should be performed before a pre-authorization pharmacovigilance inspection is requested.

154 If the outcome of the pre-authorization inspection raises concerns about the applicant's ability to
155 comply with the national pharmacovigilance requirements, the following recommendations may be
156 considered:

157

- non-approval of the marketing authorization;
- 158
 - a re-inspection before approval of the marketing authorization to confirm that critical findings
159 and recommendations have been addressed;
 - 160
 - granting of the marketing authorization with the recommendation to perform an early post-
161 authorization pharmacovigilance inspection. In this case, the findings would influence the timing
162 of an inspection conducted as part of the national routine program of pharmacovigilance
163 inspections in Lebanon (see III.B.2), and the imposition of safety conditions on the marketing
164 authorization.

165

166 *III.B.1.4. Post-authorization inspections*

167 Post-authorization pharmacovigilance inspections are inspections performed after a marketing
168 authorization is granted and are intended to examine whether the marketing authorization holder
169 complies with its pharmacovigilance obligations. They can be any of the types mentioned under
170 III.B.1.1 and IIIB.1.2.

171

172 *III.B.1.5. Announced and unannounced inspections*

173 It is anticipated that the majority of inspections will be announced i.e., notified in advance to the
174 inspected party, to ensure the availability of relevant individuals for the inspection. However, on
175 occasion, it may be appropriate to conduct unannounced inspections or to announce an inspection at
176 short notice (e.g., when the announcement could compromise the objectives of the inspection or
177 when the inspection is conducted in a short timeframe due to urgent safety reasons).

178

179 *III.B.1.6. Re-inspections*

180 A re-inspection may be conducted on a routine basis as part of a routine inspection program. Risk
181 factors will be assessed in order to prioritize re-inspections. Early re-inspection may take place where
182 significant non-compliance has been identified and where it is necessary to verify actions taken to
183 address findings and to evaluate ongoing compliance with the obligations, including evaluation of
184 changes in the pharmacovigilance system. Early re-inspection may also be appropriate when it is
185 known from a previous inspection that the inspected party had failed to implement appropriate
186 corrective and preventive actions in response to an earlier inspection.

187

188 *III.B.1.7. Remote inspections*

189 These are pharmacovigilance inspections performed by inspectors remote from the premises of the
190 marketing authorization holder or service providers employed by the marketing authorization holder.
191 Communication mechanisms such as the Internet or telephone may be used in the conduct of the
192 inspection. For example, in cases where key sites for pharmacovigilance activities are located outside
193 Lebanon or a service provider is not available at the actual inspection site, but it is feasible to arrange
194 interviews of relevant staff and review of documentation, including the safety database, source
195 documents, and pharmacovigilance system master file, via remote access. This approach may also be
196 taken where there are logistical challenges to an on-site inspection during exceptional circumstances
197 (e.g., a pandemic outbreak or travel restrictions). Such approaches are taken at the discretion of the
198 inspectors and in agreement with the body commissioning the inspection. The logistical aspects of the
199 remote inspection should be considered following liaison with the marketing authorization holder.

200 Where feasible, a remote inspection may lead to a visit to the inspection site if it is considered that
201 the remote inspection has revealed issues that require on-site inspection or if the objectives of the
202 inspection cannot be met by remote inspection.

203

204 **III.B.2. Inspection planning**

205 Pharmacovigilance inspection planning should be based on a systematic and risk-based approach to
206 make the best use of surveillance and enforcement resources whilst maintaining a high level of public
207 health protection. A risk-based approach to inspection planning will enable the frequency, scope, and
208 breadth of inspections to be determined accordingly.

209 To ensure that inspection resources are used efficiently, the scheduling and conduct of inspections
210 will be driven by the preparation of inspection programs. Sharing of information and communication
211 between pharmacovigilance inspectors and assessors is important to ensure successful prioritization
212 and targeting of these inspections.

213 Factors that may be taken into consideration, as appropriate, by the national competent authorities
214 when establishing pharmacovigilance inspection programs include, but are not limited to:

215 ▪ **Inspection related:**

216 – compliance history identified during previous pharmacovigilance inspections or other
217 types of inspections where appropriate (GCP, GMP, GLP, and GDP);
218 – re-inspection date recommended by the inspectors or assessors as a result of a
219 previous inspection.

220 ▪ **Product related:**

221 – product with additional pharmacovigilance activities or risk-minimization activities;
222 – authorization with conditions associated with safety, e.g., requirement for post-
223 authorization safety studies (PASS) or designation for additional monitoring;
224 – product(s) with large sales volume, i.e., products associated with large patient
225 exposure in Lebanon;
226 – product(s) with limited alternatives in the marketplace.

227 ▪ **Marketing authorization holder related:**

228 – marketing authorization holder that has never been subject to a pharmacovigilance
229 inspection;
230 – marketing authorization holder with many products on the market in Lebanon;
231 – resources available to the marketing authorization holder for the pharmacovigilance
232 activities they undertake, including resources for the oversight and management of
233 subcontracted pharmacovigilance activities;
234 – marketing authorization holder with no previous marketing authorizations in
235 Lebanon;

236 – negative information and/or safety concerns raised by the national competent
237 authority, other bodies/competent authorities outside Lebanon, or other areas if applicable
238 (i.e., GCP, GMP, GLP, and GDP);
239 – changes in the marketing authorization holder organization, such as mergers and
240 acquisitions.

241 ▪ **Pharmacovigilance system related:**

242 – marketing authorization holder with sub-contracted pharmacovigilance activities
243 (function of the qualified person responsible for pharmacovigilance (QPPV/LSR) in Lebanon,
244 reporting of safety data, etc.) and/or multiple service providers employed to perform
245 pharmacovigilance activities; where pharmacovigilance tasks are subcontracted, delegation
246 arrangements, respective responsibilities, and audit and inspection arrangements shall be
247 clearly documented. Service providers performing pharmacovigilance activities in whole or
248 in part on behalf of, or in conjunction with, the marketing authorization holder shall agree to
249 be audited by or on behalf of the marketing authorization holder and may be inspected by
250 the national competent authority, irrespective of whether such obligations are explicitly
251 included in the subcontract;

252 – change of QPPV/local safety responsible (LSR) since the last inspection;

253 – changes to the pharmacovigilance safety database(s), which could include a change
254 in the database itself or associated databases, the validation status of the database, as well
255 as information about transferred or migrated data;

256 – changes in contractual arrangements with pharmacovigilance service providers or the
257 sites at which pharmacovigilance is conducted;

258 – delegation or transfer of the pharmacovigilance system master file management.

259 The national competent authority may solicit information from marketing authorization holders for
260 risk-based inspection planning purposes if it is not readily available elsewhere.

261

262 **III.B.3. Sites to be inspected**

263 Any party carrying out pharmacovigilance activities in whole or in part, on behalf of, or in conjunction
264 with the marketing authorization holder, may be inspected, in order to confirm their capability to
265 support the marketing authorization holder's compliance with pharmacovigilance obligations.

266 The sites to be inspected may be located in or outside Lebanon. However, where key
267 pharmacovigilance activities, such as the main pharmacovigilance center, safety databases, or
268 subcontracted pharmacovigilance activities, are located outside Lebanon, inspections of sites outside
269 Lebanon may be considered on a case-by-case basis, where feasible and appropriate, and where it
270 would otherwise be inefficient or not possible to confirm compliance from a site within Lebanon.

271 In such cases, the national competent authority may, where appropriate, rely on cooperation,
272 information sharing, or coordination with other competent authorities, in accordance with applicable
273 legal and administrative arrangements.

274 The type and number of sites to be inspected should be selected appropriately to ensure that the key
275 objectives within the scope of the inspection are met.

276

277 **III.B.4. Inspection scope**

278 The inspection scope will depend on the objectives of the inspection as well as the coverage of any
279 previous inspections by the national competent authority and whether it is a system or product-
280 related inspection (a description of the types of inspection, inspection triggers, and points to consider
281 for the different types of inspection is provided in III.B.1).

282 The following elements should be considered when preparing the scope of the inspection, as
283 applicable:

- 284 ▪ information supplied in the pharmacovigilance system master file;
- 285 ▪ information concerning the functioning of the pharmacovigilance system, e.g., compliance
286 data available from the national competent authority, such as the National Pharmacovigilance and
287 Safety Reports database, reporting, and data quality audits;
- 288 ▪ specific triggers (see III.B.1.2. for examples of triggers).

289 It may be appropriate for additional data to be requested in advance of an inspection in order to select
290 appropriate sites or clarify aspects of the pharmacovigilance system.

291

292 ***III.B.4.1. Routine pharmacovigilance inspections***

293 Routine pharmacovigilance inspections should examine compliance with national competent
294 authority legislation and guidance, and the scope of such inspections should include the following
295 elements, as appropriate:

296 **▪ Individual Case Safety Reports (ICSRs):**

297 – collecting, receiving, and exchanging reports from all types of sources, sites, and
298 departments within the pharmacovigilance system, including from service providers
299 employed to fulfill marketing authorization holders' pharmacovigilance obligations and
300 departments other than drug safety;

301 – assessment, including mechanisms for obtaining and recording reporter assessments,
302 company application of event terms, seriousness, expectedness, and causality. In addition to
303 examples of domestic ICSRs (from within Lebanon), examples of ICSRs reported from outside
304 Lebanon should be examined as part of this review (if applicable and if requested);

305 – follow-up and outcome recording, for example, the outcome of cases of exposure in
306 pregnancy and medical confirmation of consumer-reported events;

307 – reporting according to the requirements for various types of reported ICSRs, including
308 onward reporting to the national competent authority and the timeliness of such reporting;

309 – record keeping and archiving for ICSRs;

310 **▪ Periodic Safety Update Reports (PSURs):**

311 – completeness and accuracy of the data included, appropriateness of decisions
312 concerning data that are not included;

313 – addressing safety topics, providing relevant analyses and actions;

314 – formatting according to requirements;

315 – timeliness of submissions;

316 **▪ Ongoing safety evaluation:**

317 – use of all relevant sources of information for signal detection;

318 – appropriately applied methodology concerning analysis;

319 – appropriateness of investigations and follow-up actions, e.g., the implementation of
320 recommendations following data review;

321 – implementation of the RMP, or other commitments, e.g., conditions of marketing
322 authorization;

323 – timely identification and provision of complete and accurate data to the national
324 competent authority, in particular in response to specific requests for data;

325 – implementation of approved changes to safety communications and product
326 information, including internal distribution and external publication;

327 ▪ **Interventional (where appropriate) and non-interventional clinical trials:**

328 – reporting suspected unexpected serious adverse reactions (SUSARs) and non-
329 interventional study cases according to the national regulations;

330 – receiving, recording, and assessing cases from interventional and non-interventional
331 trials (see ICSRs);

332 – submission of study results and relevant safety information (e.g. Development Safety
333 Update Reports (DSURs) and information included in PSURs), where applicable, PASS or Post-
334 Authorization Efficacy Studies (PAES) submissions, particularly when associated with specific
335 obligations or RMP commitments;

336 – appropriate selection of reference safety information, maintenance of investigator
337 brochures, and patient information with respect to safety, where applicable;

338 – the inclusion of study data in ongoing safety evaluation;

339 ▪ **Pharmacovigilance system:**

340 – QPPV/LSR roles and responsibilities, e.g., access to the quality system, the
341 pharmacovigilance system master file, performance metrics, audit and inspection reports,
342 and their ability to take action to improve compliance;

343 – the roles and responsibilities of the marketing authorization holder in relation to the
344 pharmacovigilance system;

345 – accuracy, completeness, and maintenance of the pharmacovigilance system master
346 file;

347 – quality and adequacy of training, qualifications, and experience of staff;

348 – coverage and adherence to the quality system concerning pharmacovigilance,
349 including quality control and quality assurance processes;

350 – fitness for the purpose of computerized systems;

351 – contracts and agreements with all relevant parties appropriately reflect
352 responsibilities and activities in the fulfillment of pharmacovigilance, and are adhered to.

353 As a general approach, a marketing authorization holder should be inspected based on risk-based
354 considerations, but it is recommended to routinely inspect the MAH at least once every 4 years.

355 The inspection may include the system for the fulfillment of conditions of a marketing authorization
356 and the implementation of risk-minimization activities, as they relate to any of the above safety
357 topics.

358

359 *III.B.4.2. For cause inspections*

360 The scope of the inspection will depend on the specific trigger(s). Some, but not all of the elements
361 listed in III.B.4.1 and below, may be relevant:

362 ▪ QPPV/LSR involvement and awareness of product-specific issues;

363 ▪ in-depth examination of processes, decision-making, communications, and actions relating to
364 a specific trigger and/or product.

365

366 *III.B.4.3. Re-inspections*

367 For the scope of a re-inspection, the following aspects should be considered:

368 ▪ review of the status of the system and/or corrective and preventive action plan(s) resulting
369 from previous pharmacovigilance inspection(s);

370 ▪ review of significant changes that have been made to the pharmacovigilance system since the
371 last pharmacovigilance inspection (e.g., changes in the pharmacovigilance database, company
372 mergers or acquisitions, significant changes in contracted activities, changes in QPPV/LSR as
373 appropriate);

374 ▪ review of process and/or product-specific issues identified from the assessment of
375 information provided by the marketing authorization holder, or not covered in a prior inspection.

376 The scope of re-inspection will depend on the inspection history. It may be appropriate to conduct a
377 complete system review, for example, if a long time has elapsed since the previous inspection, in which
378 case the elements listed in III.B.4.1. may be considered for the inspection scope, as appropriate.

379

380 **III.B.5. Inspection process**

381 Pharmacovigilance inspections should be planned, coordinated, conducted, reported on, followed up
382 on, and documented in accordance with national inspection procedures.

383 The pharmacovigilance inspection procedure will cover at least the following processes:

384 ▪ sharing of information;

385 ▪ Inspection planning;

386 ▪ pre-authorization inspections;

387 ▪ coordination of pharmacovigilance inspections in Lebanon (where applicable), including
388 coordination within the national competent authority and with the Ministry of Public Health
389 inspection department, and, where relevant, with other national bodies involved in
390 pharmacovigilance, medicines regulation, or public health oversight, in order to ensure
391 consistency, avoid duplication, and support effective inspection follow-up;

392 ▪ coordination of inspections involving sites or contractors located outside Lebanon (where
393 applicable), which may include cooperation, information exchange, or coordination with other
394 competent authorities, in accordance with applicable legal and administrative arrangements);

395 ▪ preparation of pharmacovigilance inspections;

396 ▪ conduct of pharmacovigilance inspections;

397 ▪ reporting of pharmacovigilance inspections and inspection follow-up;

398 ▪ communication and prioritization of pharmacovigilance inspections and findings;

399 ▪ interaction with the national pharmacovigilance committee (if applicable) in relation to
400 inspections and their follow-up;

401 ▪ record-keeping and archiving of documents obtained or resulting from pharmacovigilance
402 inspections;

403 ▪ unannounced inspections;

404 ▪ sanctions and enforcement in case of serious non-compliance;

405 ▪ recommendations on the training and experience of inspectors performing

406 pharmacovigilance inspections.

407 These procedures will be revised and updated as deemed necessary. New procedures may also be

408 developed when the need is identified with the inspection process.

409

410 **III.B.6. Inspection follow-up**

411 When non-compliance with pharmacovigilance obligations is identified during an inspection, follow-up will be required until a corrective and preventive action plan is completed. The following follow-up actions should be considered, as appropriate:

414 ▪ review of the marketing authorization holder's corrective and preventive action plan;

415 ▪ review of the periodic progress reports, when deemed necessary;

416 ▪ re-inspection to assess appropriate implementation of the corrective and preventive action plan;

417

418 ▪ requests for submission of previously un-submitted data; submission of variations, e.g., to

419 amend product information; submission of impact analyses, e.g., following review of data that

420 were not previously considered during routine signal detection activities;

421 ▪ requests for issuing safety communications, including amendments of marketing and/or

422 advertising information;

423 ▪ requests for a meeting with the marketing authorization holder to discuss the deficiencies,

424 the impact of the deficiencies, and action plans;

425 ▪ other product-related actions depending on the impact of the deficiencies and the outcome

426 of follow-up actions (this may include recalls or actions relating to the marketing authorizations

427 or clinical trial authorizations).

428 Sharing of information and communication within the national competent authority, including among

429 staff involved in pharmacovigilance inspection and assessment activities, is important for the proper

430 follow-up of inspections and the formulation of appropriate recommendations on actions to be taken.

431

432 **III.B.7. Regulatory actions and sanctions**

433 According to the national legislation and regulations, in order to protect public health, the national
434 competent authorities are obliged to ensure compliance with pharmacovigilance obligations. When
435 non-compliance with pharmacovigilance obligations is detected, the necessary action will be judged
436 on a case-by-case basis. What action is taken will depend on the potential negative public health
437 impact of the non-compliance(s), but any instance of non-compliance may be considered for
438 enforcement action. The national competent authority shall take the necessary measures to ensure
439 that a marketing authorization holder is subject to effective, proportionate, and dissuasive penalties.
440 Moreover, financial penalties may be imposed on the holders of marketing authorizations to ensure
441 the enforcement of certain obligations connected with marketing authorizations for medicinal
442 products. In the event of non-compliance, possible regulatory options include the following, in
443 accordance with guidance and, as applicable, rules set in legislation:

- 444 ▪ **Education and facilitation:** the national competent authority may communicate with marketing
445 authorization holder representatives (e.g. in a meeting) to summarize the identified non-compliances,
446 to clarify the legal requirements and the expectations of the regulator, and to review the marketing
447 authorization holder's proposals for corrective and preventive actions;
- 448 ▪ **Inspection:** non-compliant marketing authorization holders may be inspected to determine the
449 extent of non-compliance and then re-inspected to ensure that compliance is achieved;
- 450 ▪ **Warning letter, non-compliance statement, or infringement notice:** these are instruments that
451 national competent authorities may issue stating the legislation and guideline(s) that have been
452 breached, reminding marketing authorization holders of their pharmacovigilance obligations, or
453 specifying the steps that the marketing authorization holder must take and the timeframe within
454 which to rectify the non-compliance and prevent further non-compliance;
- 455 ▪ The national competent authority may consider making public a list of marketing authorization
456 holders found to be seriously or persistently non-compliant;
- 457 ▪ **Actions against a marketing authorization or authorization application, e.g.:**
 - 458 • Urgent Safety Restriction;
 - 459 • variation of the marketing authorization;
 - 460 • suspension or revocation of the marketing authorization;

461 • delays in the approval of new marketing authorization applications until corrective and
462 preventive actions have been implemented, or the addition of safety conditions to new
463 authorizations;

464 • requests for pre-authorization inspections;

465 ▪ **Product recalls**, e.g. where important safety warnings have been omitted from product information;

466 ▪ **Action relating to marketing or advertising information**;

467 ▪ **Amendments or suspension of clinical trials** due to product-specific safety issues;

468 ▪ **Financial or administrative penalties** may be considered in the future, subject to the establishment
469 of an appropriate legal and regulatory framework;

470 ▪ **Referral for criminal prosecution** with the possibility of imprisonment (in accordance with national
471 legislation).

472

473 **III.B.8. Record management and archiving**

474 The principles and requirements to be followed will be described in the procedure on Record Keeping
475 and Archiving of Documents Obtained or Resulting from the Pharmacovigilance Inspections referred
476 to in III.B.5.

477

478 **III.B.9. Qualification and training of inspectors**

479 Inspectors who are involved in the conduct of pharmacovigilance inspections requested by the
480 national competent authority should be officials of, or appointed by, the national competent authority
481 in accordance with national regulations and follow the provisions of the national competent authority.

482 It is recommended that inspectors are appointed based on their experience (especially in
483 pharmacovigilance) and the minimum requirements defined by the national competent authority. In
484 addition, consideration should be given to the recommendations for training and experience
485 described in the pharmacovigilance inspection procedures.

486 The inspectors should undergo training to the extent necessary to ensure their competence in the
487 skills required for preparing, conducting, and reporting inspections. They should also be trained in
488 pharmacovigilance processes and requirements in such a way that they are able, if not acquired by
489 their experience, to comprehend the different aspects of a pharmacovigilance system.

490 Documented processes should be in place in order to ensure that inspection competencies are
491 maintained. In particular, inspectors should be kept updated with the current status of
492 pharmacovigilance legislation and guidance.

493 Training and experience should be documented individually and evaluated according to the
494 requirements of the applicable quality system of the concerned competent authority.

495

496 **III.B.10. Quality management of the pharmacovigilance inspection process**

497 The quality of the pharmacovigilance inspection process is managed by the national competent
498 authorities and covered by their pharmacovigilance systems and associated quality systems, meaning
499 that the process is also subject to audit. Guidance on the establishment and maintenance of a quality-
500 assured pharmacovigilance system is provided in Module I.

501

502 **III.C. Operation of pharmacovigilance inspections in Lebanon**

503

504 **III.C.1. Role of the national competent authority**

505 The national competent authority should establish the legal and administrative framework within
506 which pharmacovigilance inspections operate, including the definition of the rights of inspectors for
507 inspecting pharmacovigilance sites and access to pharmacovigilance data.

508 The national competent authority should provide sufficient resources and appoint adequately
509 qualified inspectors to ensure effective determination of compliance with good pharmacovigilance
510 practice. The inspector(s) appointed may be accompanied, when needed, by expert(s) on relevant
511 areas.

512 Pharmacovigilance inspections should be planned, coordinated, conducted, reported on, followed up
513 on, and documented in accordance with national inspection procedures. The scheduling and conduct
514 of these inspections will be driven by the preparation of inspection programs based on a systematic
515 and risk-based approach as outlined in III.B.2.

516

517 *III.C.1.1. Inspection Programs*

518 A program for routine inspections of authorized products in Lebanon will be determined by the
519 national competent authority. These inspections will be prioritized based on the potential risk to
520 public health, considering the factors listed in III.B.5. As a general approach, a marketing authorization
521 holder should be inspected based on risk-based considerations, but it is recommended to routinely
522 inspect MAH at least once every 4 years.

523 If the same pharmacovigilance system is used for a variety of authorizations, then the results of a
524 competent authority inspection may apply to all products covered by that system. This routine
525 inspection program will be separate from any “for-cause” inspections, but if a “for-cause” inspection
526 takes place it may replace the need for one under this program, dependent on its scope.

527 The national competent authority is also responsible for the planning and coordination of
528 pharmacovigilance inspections in order to ensure compliance with the national legislation and to
529 verify the effectiveness of the marketing authorization holder’s pharmacovigilance system.

530 Based on the information from other inspections, the national competent authority will prioritize the
531 inspections in its program and will use the information for the preparation of an appropriate scope
532 for the inspection. For example, the national competent authority may seek to verify the fulfillment
533 of requirements concerning the implementation of specific risk-minimization measures,
534 communications concerning safety, locally conducted safety studies, or issues linked to national
535 healthcare systems. A broader examination of pharmacovigilance applied to particular products of
536 national interest may also be appropriate.

537 Deficiencies are classified by the assessed risk level and may vary depending on the nature of the
538 medicine. In some circumstances, an otherwise major deficiency may be categorized as critical. A
539 deficiency reported after a previous inspection and not corrected may be given a higher classification.

540

541 *III.C.1.2. Cooperation and Sharing of Information*

542 The national competent authority may, where appropriate, engage in cooperation and information
543 sharing related to pharmacovigilance inspections, with the objective of supporting effective inspection
544 planning, avoiding unnecessary duplication of activities, and promoting the exchange of good
545 practices. Such cooperation may include informal information exchange, training activities, or

546 experience sharing, subject to feasibility and in accordance with applicable national legal and
547 administrative arrangements.

548 **III.C.2. Role of the Marketing Authorization Holders and Applicants**

549 Marketing authorization holders with authorized products and applicants who have submitted new
550 applications are subject to pharmacovigilance inspections (see III.B.1). Therefore, both have
551 responsibilities in relation to inspections, including but not limited to the following:

- 552 ▪ Always be inspection-ready as inspections may be unannounced.
- 553 ▪ To maintain and make available to the inspectors on request, no later than 14 days after The
554 receipt of a request, the pharmacovigilance system master file, and /or PSSF.
- 555 ▪ To ensure that the sites selected for inspection, which may include service providers
556 employed by the marketing authorization holder (such as service providers) to perform
557 pharmacovigilance activities, agree to be inspected before the inspection is performed.
- 558 ▪ To make available to the inspectors any information and/or documentation required for the
559 preparation of the inspection within the deadline given or during the conduct of the inspection.
- 560 ▪ To ensure that relevant staff involved in pharmacovigilance activities or related activities are
561 present and available during the inspection for interviews or clarification of issues identified.
- 562 ▪ To ensure that relevant pharmacovigilance data is accessible
- 563 ▪ To ensure that appropriate and timely corrective and preventive action plans are
564 implemented to address findings observed during an inspection, with appropriate prioritization of
565 critical and/or major findings.

566

567 **III.C.3. Inspection Fees**

568 For pharmacovigilance inspections, inspection fees and related expenses may be applicable in
569 accordance with national laws and regulations, where such provisions are established.
